FINISHING (COLOUR)						✓ ✓

✓ Shows application of product and timing ✓ ✓ Shows two applications of product during this growth period.

A program developed for the production of high quality Capsicums.

Using extremely high quality nutrients targeted at specific growth stages the AgroBest Capsicum program gives producers the flexibility to manage their crop and maximise their yield. This is achieved by controlling Nitrogen applications and the use of high uptake trace elements. The program also includes FulFil, a unique formulation of natural growth promotants which, has proven to substantially increase flowering and fruit set.

Early balanced NPK is followed by regular Calcium, which is a vital part of the program. We recommend AgroDex CaB (Calcium + Boron) for foliar application or CarboCal applied through the irrigation. CarboCal is ideal for latter application as it contains no Nitrates or Chlorides. For those using Cal Nitrate we recommend CalMate, to increase uptake.

As a finishing spray we use AgroDex K35. This is the ideal product for application at this time as it contains no chloride or nitrate which can result in late leaf flush. K35 also contains natural plant regulators and organic acids.

For ease of application AgroBest products are compatible with many insecticides and fungicides.

AgroBest Australia recommends that regular soil and plant tissue analysis be carried out for maintenance of correct nutritional levels.

NOTES

- Fulfil applied 14 days apart to extend flowering.
- Beyond Foliar 3-10-15 contains trace elements for a balanced foliar spray.
- Agrodex CaB as a foliar or alternatively Carbo Cal at 10L/Ha through the irrigation.
- Monitor nutrient status through tissue analysis, and adjust timing and application of plant food accordingly.
- If under disease pressure apply Extra Cal every week after flowering until crop is finished to maintain protection.

This program is designed to augment a soil fertility program and is offered as a guide only and dependent on growing conditions i.e. soil, climate, disease etc. Observe correct spray procedures as factors such as temperature, humidity, water rates can effect results. Always check compatibility before mixing products. Grower assumes all responsibility. Monitor nutrient status through tissue and soil analysis.
