✓ ✓ Shows two applications of product during this growth period.

The AgroBest Cereal Crop Program is designed to give the grower the basic requirements for a high yielding, high quality crop.

The program should be used with a basal fertiliser schedule based on local conditions and crop nutritional requirements.

The AgroBest Cereal crop program starts with Super Seedtreat, our Zinc (Seaweed based) nutritional seed coating which contains a range of micronutrients. Super Seedtreat has proven to give extremely good early growth response, which sets the crop up for increased yield. A wide range of trace elements including Zinc, Magnesium and Copper are available for post germination application. These are all produced using the unique AMCA System which guarantees very high uptake and plant availability. N42 and Beyond Foliar (NPK with Trace Elements) are used for instant top up at any growth stage to maximise yield potential.

For ease of application AgroBest products are compatible with many insecticides, herbicides and fungicides.

AgroBest Australia recommends that regular soil and plant tissue analysis be carried out for maintenance of correct nutritional levels.

NOTES

- Apply Phozstart ZZ in furrow at planting.
- All foliar Zinc applications maximise yields when applied between 3 leaf and early tillering.
- Apply Quickstart HiTrace as required to kickstart crop after 3 leaf stage, or under water logged and/or cold conditions.
- Use Broadhectar ZN MN for Manganese deficient areas.
- AgroBest Foliars are in additions to a regular soil fertilizer program.
- Monitor nutrients status through tissue analysis, and adjust timing and application of plant food accordingly.
- Use Agrodex Sko on high yielding varieties where lodging may occur.
- (A) Can be applied with Grass herbicide.

This program is designed to augment a soil fertility program and is offered as a guide only and dependent on growing conditions i.e. soil, climate, disease etc. Observe correct spray procedures as factors such as temperature, humidity, water rates can effect results. Always check compatibility before mixing products. Grower assumes all responsibility. Monitor nutrient status through tissue and soil analysis.
