✓✓ Shows two applications of product during this growth period.

The AgroBest Cotton Crop Program is designed to give the grower the basic requirements for a high yielding, high quality crop.

The program should be used with a basal fertiliser schedule based on local conditions and crop nutritional requirements.

The AgroBest Cotton Crop Program starts with Super Seedtreat, our Zinc (Seaweed based) nutritional seed coating which contains a range of micronutrients. Super Seedtreat has proven to give extremely good early growth response, which sets the crop up for increased yield. A wide range of trace elements including Zinc and Boron are available for post germination application. These are all produced using the unique AMCA System which guarantees very high uptake and plant availability. Phosphorous and Potassium applications are recommended at the peak demand periods of flowering and boll fill. Agrodex K45 is the ideal product for application at boll fill as it contains no chloride or nitrate which can result in late leaf flush.

For ease of application AgroBest products are compatible with many insecticides, herbicides and fungicides.

AgroBest Australia recommends that regular soil and plant tissue analysis be carried out for maintenance of correct nutritional levels.

NOTES

- AgroBest Foliars are in additions to a regular soil fertilizer program.
- Monitor nutrients status through tissue analysis, and adjust timing and application of plant food accordingly.

This program is designed to augment a soil fertility program and is offered as a guide only and dependent on growing conditions i.e. soil, climate, disease etc. Observe correct spray procedures as factors such as temperature, humidity, water rates can effect results. Always check compatibility before mixing products. Grower assumes all responsibility. Monitor nutrient status through tissue and soil analysis.
