A program developed for the production of high quality Longans.

Using extremely high quality nutrients targeted at specific growth stages the AgroBest Longan program gives producers the flexibility to manage their crop and maximise their yield. This is achieved by controlling Nitrogen applications and the use of high uptake trace elements. Early Boron is followed by regular Calcium, which is a vital part of the program. We recommend AgroDex CaB (Calcium + Boron) for foliar application or CarboCal applied through the irrigation. As a finishing spray we use AgroDex K35. This is the ideal product for application at this time as it contains no chloride or nitrate which can result in late leaf flush. K35 also contains natural plant regulators and organic acids.

For ease of application AgroBest products are compatible with many insecticides and fungicides.

AgroBest Australia recommends that regular soil and plant tissue analysis be carried out for maintenance of correct nutritional levels.

#### **NOTES**

- AgroBest foliar fertilizers should be used in conjunction with a regular soil fertilizer program.
- Beyond Foliar 3-10-15 contains trace elements for a balanced foliar spray.
- Monitor nutrients status through tissue analysis, and adjust timing and application of plant food accordingly.

This program is designed to augment a soil fertility program and is offered as a guide only and dependent on growing conditions i.e. soil, climate, disease etc. Observe correct spray procedures as factors such as temperature, humidity, water rates can effect results. Always check compatibility before mixing products. Grower assumes all responsibility. Monitor nutrient status through tissue and soil analysis.
