The AgroBest Mango crop program is a basic combination of micronutrients, trace elements and NPK plant foods.

Most orchards will require various levels of other trace elements based on soil and leaf test data. Trace elements such as Boron and Zinc recommended at spring flush, adequate levels must be maintained. The basic crop program is used to ensure flowering, fruit set, yield and quality. NPK levels are controlled to accommodate various growth stages. For maintenance of NPK levels we recommend Beyond Foliar 3-10-15, which has very high-grade raw materials combined with a range of micronutrients. The program also includes FulFil, a unique formulation of natural growth promotants, which has proven to substantially increase flowering and fruitset. Late applications of Calcium are recommended to maintain yield potential and quality.

To ripen, fill and colour the crop we also recommend AgroDex K35. AgroDex K35 is the ideal product for application at this time as it contains no chloride or nitrate which can result in late leaf flush. K35 also contains natural plant regulators and organic acids to assist with improved yield.

AgroBest Australia recommends that regular soil and plant tissue analysis be carried out for maintenance of correct nutritional levels.

#### NOTES

- Above rates are for foliar application with the exception of Revitalize.
- Alternatively, above products can be applied through fertigation (exceptions: Agrodex K35 & Fulfil)
- Tissue analysis should be sought to monitor nutrient status of Mangoes.
- Adjust plant food rates according to plant vigor and results of analysis.
- Adjust K rates according to crop load.
- AgroDex P & K can be used if nitrogen is not required.
- Agrodex Zn or Agrodex Mg can be applied if a deficiency.

This program is designed to augment a soil fertility program and is offered as a guide only and dependent on growing conditions i.e. soil, climate, disease etc. Observe correct spray procedures as factors such as temperature, humidity, water rates can effect results. Always check compatibility before mixing products. Grower assumes all responsibility. Monitor nutrient status through tissue and soil analysis.
