The AgroBest Olive crop program is a basic combination of micronutrients, trace elements and NPK plant foods.

Most trees will require various levels of other trace elements based on soil and leaf test data. Trace elements such as Boron and Calcium recommended at spring flush, adequate levels must be maintained for flowering and fruit set. The basic crop program is used to ensure flowering, fruit set, yield and quality. NPK levels are controlled to accommodate various growth stages. For maintenance of NPK levels we recommend Beyond Foliar 3-10-15, which has very high-grade raw materials combined with a range of micronutrients. The program also includes FulFil, a unique formulation of natural growth promotants, which has proven to substantially increase flowering and fruit set. Late applications of Calcium are recommended to maintain yield potential and quality. We have recommended AgroCal N, which is a very cost effective alternative.

AgroBest Australia recommends that regular soil and plant tissue analysis be carried out for maintenance of correct nutritional levels.

NOTES

- Monitor nutrient status through tissue analysis.

This program is designed to augment a soil fertility program and is offered as a guide only and dependent on growing conditions i.e. soil, climate, disease etc. Observe correct spray procedures as factors such as temperature, humidity, water rates can effect results. Always check compatibility before mixing products. Grower assumes all responsibility. Monitor nutrient status through tissue and soil analysis.
